

CD&E – Concept Development & Experimentation + HERMES 5

A simple and efficient scientific approach to integrating the CD&E process in to the new HERMES 5 project management method

Concept Development and Experimentation (CD&E) is a method which makes it possible to predict by experimentation whether concepts, theoretical constructs, sub-systems or systems provide the capabilities required by the transformation and can be usefully integrated into the overall system.

The design, planning and execution of experiments in the field calls for careful preparation and optimum risk management.

Against this background, armasuisse S+T together with A-PLAN will be offering a tool as of 2018 to manage the risks arising in connection with CD&E. A simplified process with direct internet access will be made available to all project managers who would like to familiarise themselves with this new procedure.
